

What is claimed is:

1. (Currently Amended) A data processing system for executing a secure an e-financial transaction ~~for in~~ an account ~~having at least one customer specified~~ secure parameter, without disclosing any personal financial information, comprising:
a central controller including a CPU and a memory operatively connected to said CPU;
at least one terminal, adapted for communicating with said central controller, by transmitting the secure parameter to said central controller; said memory in said central controller containing a program, adapted to be executed by said CPU, for executing e-financial transactions for the secure parameter, wherein the secure parameter is a password or code; wherein said central controller receives the secure parameter from said terminal and executes the e-financial transaction for the account based upon the secure parameter, without requiring access to personal financial, banking or credit card information;
said system comprising:
a central controller located at a bank, said controller including a CPU and a memory operatively connected to said CPU;
a client's input/output device purchased from the bank for a given amount, said device having a secure password from the central controller assigned to it and installed onto the client's computer;
a merchant's website;
wherein the e-financial transaction starts with:

- the client placing an order using the secure password assigned to the client's input/output device,
 - the merchant website relaying the input data to the central controller, and
 - the central controller validating the client's secure password and order and authorizing or denying the order based on the client's input/output secure password for the account, without accessing any personal data of the client.
2. (Previously presented) The system according to claim 1, wherein the ~~terminal comprises an~~ input/output device, ~~wherein the terminal~~ is further adapted to transmit a customer's information to said controller, and said program in said memory executes the financial transaction in the account having the secure parameter based upon the customer's information.
 3. (Currently amended) The system according to claim 2, wherein the customer information comprises an account identifier that specifies a pre-existing bank ~~account~~ account, and said secure parameter comprises a secure password.
 4. (Original) The system according to claim 1, wherein said program in said memory is adapted to receive a customer acceptance via said terminal to enter into an account having the secure parameter and charge the customer the calculated amount of funds by debiting the customer's account and transferring the funds to a bank account specified by the customer.
 5. (Original) The system according to claim 2, wherein the input/output device comprises an electronic vault, a microcomputer chip or smart card.
 6. (Currently amended) The system according to claim 3, wherein the secure password is transferred using an encryption technology.

7. (Currently Amended) A method of executing an e-financial transaction having at least one customer specified secure ~~parameter using a central controller including a CPU and a memory operatively connected to said CPU and containing a program adapted to be executed by said CPU for calculating the amount of funds, and a terminal adapted for communicating with said central controller, password,~~ such that no personal financial information is disclosed during the transaction, the method comprising the steps of:
- transferring a specified amount of funds to a central controller located at a bank through an electronic fund transfer or cash,
- receiving an input/output device and a secure password from the central controller, and installing the device on a consumer's computer,
- placing an order on a merchant's website using the secure password,
- relaying the inputs from the customer computer and the merchant website
- ~~executing the e-financial transaction by inputting the secure password and bank information~~ to the central controller via a terminal;
- processing a program to execute or deny the e-financial transaction ~~transmitted by the secure password, the amount of funds having the password security; and~~
- ~~outputting the calculated funds from the controller to a bank account specified by the customer.~~
8. (Original) The method according to claim 7, further comprising the step of inputting customer information to the controller via the terminal, and wherein the step processing the program further comprises calculating the amount of funds based on the customer information.

9. (Original) The method according to claim 7, wherein the step of inputting the customer information further comprises inputting an account identifier that specifies a pre-existing bank account.
10. (Previously presented) A data processing system for executing an e-financial transaction having at least one customer specified ~~secret~~ secure password, wherein personal financial information is protected through the use of an input/output device, comprising:
- a CPU;
 - a memory operatively connected to said CPU,
 - said memory containing a program, adapted to be executed by said CPU, for receiving the ~~secret~~ secure password and calculating the amount of funds having the ~~secret~~ secure password; and
 - said input/output device, operatively connected to at least one of said memory and said CPU, for input of the secret password and for output of the funds.
11. (Previously presented) A method of executing an e-financial transaction , wherein personal financial information is protected through the use of an I/O device, having at least one customer specified ~~secret~~ secure password using a CPU and a memory operatively connected to said CPU and containing a program, adapted to be executed by said CPU, for calculating a price, the method comprising the steps of:
- receiving the ~~secret~~ secure password;
 - executing the program in the CPU for calculating the amount of funds having the ~~secret~~ secure password; and

out putting the funds.

12. (cancelled)
